

UX Feedback Interview — Gymnastics Athlete

1. What do you think this application is for?

From the first screens, I understand that InjuryVision 3D is an app for tracking pain, injuries, and recovery progress. It looks like it helps athletes record where they feel pain on the body and then see how that pain changes over time.

As a gymnast, I would see this as useful because pain can happen in many areas, especially wrists, shoulders, lower back, knees, and ankles. I like that the app is focused on tracking and awareness, not pretending to diagnose injuries.

2. After logging in, where would you click first?

After logging in, I would probably click **“Open 3D Body Map”** because it is clearly shown on the dashboard and seems like the main action. Since the scenario is knee pain, I would expect to go there first and select the knee on the body model.

The dashboard makes this quite clear because the button is near the top and stands out.

3. Is it clear how to open the 3D Body Map?

Yes, it is clear. There are two ways I notice it:

The **“Open 3D Body Map”** button on the dashboard.

The **“3D Body Map”** option in the left sidebar.

That is good because even if I miss one option, I can still find the feature from the navigation menu.

4. Is it clear that body parts are clickable?

Mostly yes, but I think it could be clearer.

The text says **“Click a body part to view or log pain”**, and inside the body model area it says **“Clickable body zones”**, so I understand the idea. However, because this is a low-fidelity wireframe, I cannot visually see actual clickable body parts yet.

As a gymnast, I would want the knee, wrist, shoulder, ankle, and lower back zones to be very obvious. Maybe the body model should show highlighted zones or labels when I hover over them.

5. What do you expect to happen after clicking a body part?

If I click the left knee, I expect the app to show information about that body part. The side panel does this well because it shows:

Selected body part

Current status

Pain level

Recovery status

Last updated

Previous logs

Add New Log button

That makes sense. I would expect to click **"Add New Log"** if I want to record today's pain after training.

6. Is the Add Injury Log modal easy to understand?

Yes, the modal is easy to understand. It shows the selected body part at the top, which is important because I know I am logging pain for the correct area.

The pain level slider from 0 to 10 is useful and simple. The injury status and recovery status dropdowns also make sense. The notes field is good because sometimes pain is hard to explain with only numbers.

For gymnastics, I like the idea of writing notes like "pain after landing practice" or "wrist pain during handstand training."

7. Are the fields in the injury log form enough, or is something missing?

The fields are enough for a basic MVP, but I would add a few things to make it more useful for gymnastics.

I would add **training activity** because the cause of pain matters. For example:

Landing practice

Beam training

Floor routine

Vault

Handstands

Strength training

Flexibility session

I would also add **pain trigger**, like "during movement," "after training," "when landing," or "when putting weight on the wrist."

Another useful field would be **left/right side confirmation**, because gymnasts often have pain on one side only. The app already shows "Left Knee," so that is good, but I would make sure this is always visible.

8. Is the dashboard useful, or does it show too much information?

The dashboard is useful. I do not think it shows too much information. The cards are easy to understand:

Active injuries

Average pain level

Recovery progress

Injury risk

As an athlete, I would quickly understand whether my body is improving or getting worse. The pain trend chart and recovery overview also make sense.

The only thing I would improve is adding a clearer message like:

"Your left knee pain increased this week" or "Recovery is improving compared to last week."

That would make the dashboard more helpful without needing to analyze all the numbers myself.

9. Is the injury history timeline easy to scan?

Yes, the injury history screen is quite easy to scan. I like that each log is shown as a separate card with the date, body part, status, pain level, and note.

The filters at the top are also useful. As a gymnast, I would probably filter by body part, for example wrist or ankle, because repeated pain in the same area is important to notice.

One improvement: I would make high pain logs stand out more visually. For example, pain level 8 or 9 should be more noticeable than pain level 3.

10. Does the weekly report explain the data clearly?

Yes, the weekly report is clear. I like that it starts with a short summary sentence, because that helps me understand the week quickly.

The cards for average pain, new logs, recovery progress, and risk level are useful. The body part summary is also good because I can see which areas caused the most problems.

The smart recovery suggestions are useful, but I would be careful with the wording. Since this is not medical advice, it should sound like general training awareness. For example, "consider reducing training intensity" is okay, but it should not sound like a diagnosis.

The disclaimer at the bottom is good and important.

11. Does the app feel like self-tracking instead of medical diagnosis?

Yes, it feels like a self-tracking app. The wording is mostly about pain level, recovery progress, logs, and trends. It does not feel like it is diagnosing me.

The disclaimer also helps. I would keep that visible, especially on the login screen and weekly report.

As a gymnast, I would trust it more if it clearly says that it helps me understand patterns and decide when to be more careful, but not replace a doctor, physiotherapist, or coach.

12. What would you improve first?

The first thing I would improve is the 3D Body Map interaction. Since that is the main feature, the body parts should feel more clickable and visual.

Right now, I understand the concept, but I would want to see clear clickable zones, maybe with labels or color indicators. For gymnastics, I would especially want wrists, shoulders, lower back, knees, and ankles to be easy to select.

I would also add more sport-specific context to the injury log, like what training activity caused the pain.

Top 3 UX Changes I Would Suggest

1. Make the 3D body zones more obvious

Add visible clickable zones, hover labels, or highlighted areas so users immediately understand that they can click body parts.

2. Add training activity to the injury log

For gymnastics, it would be very useful to record whether the pain happened during landing, stretching, handstands, beam, vault, or floor training.

3. Make high-risk or repeated pain easier to notice

In the dashboard and injury history, repeated pain in the same body part should stand out more clearly, especially if the pain level is increasing over time.

Overall, I think the app is clear and useful. For a gymnast, it would be helpful because it tracks repeated pain areas and recovery progress without feeling too medical. The main improvement should be making the 3D interaction stronger and adding more training context to the logs.
